Summary

Full-stack Software Engineer with **2+ years** at Webknot, currently building TalentOS, an internal AI hiring platform (FastAPI, LangGraph). Previously on Rakuten's SixthSense observability platform processing **50K–100K events per second** — Go ingestion, Kafka pipelines, and frontend architecture used by a 7-engineer team. Earlier redesigned Omron factory-monitoring pipelines. TypeScript, Go, Python, React, Kafka, PostgreSQL.

Experience

Webknot Technologies

May 2024 – Present | Bangalore, India

Software Engineer I

Client — Omron Healthcare India

Aug 2024 – Apr 2025

- Redesigned data architecture for a B2B factory monitoring system: Kafka offload of heavy jobs, isolating core services from slow vendor APIs to keep the platform available **24/7**.
- Added strict timeouts and exponential backoff on external APIs so cascading production failures stopped under peak load; fail-safe Kafka paths so telemetry is not dropped during traffic spikes.
- Containerized and operated services with Docker; added Winston logging and Grafana dashboards for production monitoring.

Client — Rakuten India (SixthSense Observability)

May 2025 – July 2026

- Built a stateless Go ingestion pipeline for real-time browser telemetry, pushing events into Kafka and processing **50K–100K events per second** at peak.
- Built REST APIs for platform infrastructure, internal tracking tools, and client dashboards; Kafka consumer groups with retries and a dead-letter queue so ingest stays up when downstream slows.
- Removed ClickHouse write-throughput as the peak bottleneck via bulk inserts, asynchronous processing, and lag-based consumer autoscaling (KEDA / HPA).
- Owned frontend architecture used by a **7-engineer team** — shared component library, theming engine, plugin system, and charting factory.
- Built a strongly-typed charting factory over ApexCharts, **reducing code duplication by ~70%**, and a type-safe theme layer with Tailwind, Ant Design Tokens, and CVA with runtime overrides.

Internal product — TalentOS

July 2026 – Present

- Built a multi-tenant AI hiring platform (React, FastAPI, PostgreSQL): Kafka workers parse resumes and LangGraph agents score them against the JD, with an audit trail on every auto-reject.
- Shipped a recruiter copilot — LangGraph supervisor plus 27 MCP tools that call the API as the logged-in user, scoped by RBAC.

Skills

Languages: TypeScript, JavaScript, Go, Python, SQL

Frontend: React, Tailwind CSS, Ant Design, ApexCharts

Backend: REST APIs, FastAPI, NestJS, Kafka, LangGraph, Microservices

Data: PostgreSQL, MySQL, SQL Server, ClickHouse, Redis

Infra: Docker, Kubernetes, KEDA, AWS, Grafana, Prometheus, CI/CD, GitHub Actions

Practices: Unit / Integration / API testing, Agile, GitHub Copilot, OpenAI Codex

Education & Achievements

- Pune University** — B.E. in Information Technology (May 2024) | CGPA: **8.34/10**
- Spot Award (Rakuten India — 2025)** — High-impact contributions to the SixthSense observability platform.
- Spot Award (Webknot Technologies — 2024)** — Recognized for feature delivery and product ownership on Taxlab.
